

Do you suffer from...?

- Herniated or Bulging Discs
- Degenerative Disc disease
- Posterior Facet Syndrome
- Sciatica
- Spinal Stenosis
- Spinal Arthritis
- Acute or chronic back & neck pain

Are you a pre- or post-surgical back patient?

You may want to consider a non-invasive, non-surgical treatment for back & neck pain that is experiencing success rates as high as 94%!* A simple evaluation by your doctor will tell you if you are a good candidate for IDD Therapy®.

*Southern Medical Association; Annual Meeting 2005.

The goal of computer-directed spinal rehabilitation is to help align facet joints, relieve nerve root pressure, reverse high intradiscal pressure and facilitate the transfer of fluids, nutrients and oxygen back inside the disc.

What is IDD Therapy® Treatment?

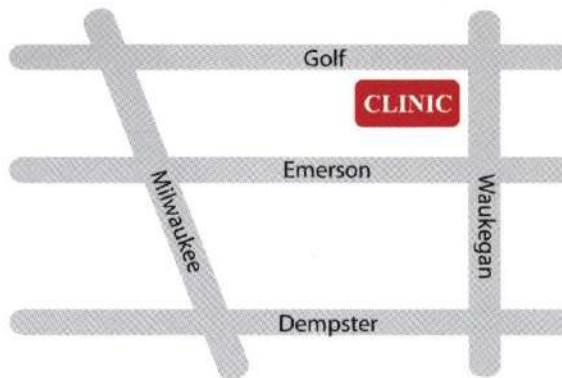

Intervertebral Differential Dynamics® Therapy is a highly precise computer-directed regimen which utilizes treatment forces to manipulate and mobilize specific spinal segments. When properly administered, the treatment is able to achieve several objectives. First, unloading compressed spinal segments helps reduce built-up pressure on the affected disc. The nature of the cyclical graduating waveform also creates a spinal pumping effect inducing a vacuum within the disc and oxygen flow essential to disc health. Finally, a secondary modality called oscillation is delivered to the surrounding muscle tissue working to release and reeducate guarded spasmed muscles. All this I performed while you rest comfortably in a soothing glow of light, listening to relaxing music.

Why should I consider IDD Therapy® Treatment?

If you are like most back & neck pain sufferers, you know the frustration of finding good treatment choices. Most options involve high risk, significant downtime and not much more than a 50% likelihood of relief. Complications from surgery can be severe and painkillers make it difficult to carry on daily activities.

IDD Therapy has an 86% - 94% success rate in the treatment of severe back & neck pain. It is a gentle, comfortable therapy that painlessly works to restore normal spinal function.

The cost of IDD Therapy is minimal when compared to surgery, epidural injections or other invasive therapies. In fact, the total cost of a full regimen of IDD Therapy will usually be less than the co-pay you will have to pay out-of-pocket to have back or neck surgery. Insurance, financing and payment options may be available to cover the cost. Ask your doctor.

HOW is IDD Therapy® Treatment administered?

IDD Therapy is administered through the Accu-SPINA®, a state-of-the-art computer-directed spinal-rehab system. The Accu-SPINA System is certified to deliver therapeutic treatment forces in a comfortable and soothing manner.

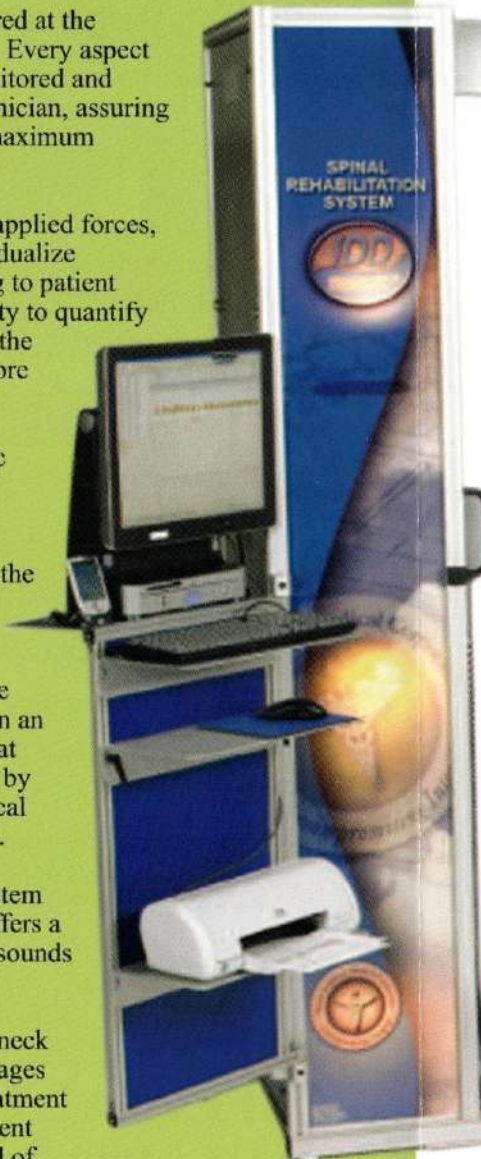

Patient data is entered at the computer interface. Every aspect of treatment is monitored and displayed to the clinician, assuring total comfort and maximum efficacy.

Active tracking of applied forces, the ability to individualize treatment according to patient needs, and the ability to quantify patient response to the treatment regimen pre and post therapy sessions further improve therapeutic results.

Fully computer-directed, the treatment regimen can be duplicated for a full rehabilitative course which is executed in an exacting manner that cannot be achieved by conventional physical therapy approaches.

Premium sound system with headphones offers a choice of soothing sounds or music.

A certified back & neck pain specialist manages each 30-minute treatment session. The treatment regimen, comprised of approximately 20-30 sessions, usually provides long-lasting results.

The Accu-SPINA® uses multiple waveforms to manipulate spinal structures:

The primary waveform is directed to a specific dysfunctional spinal segment. This waveform is directed to the vertebra and used for mobilization. This waveform may also be used to mobilize a facet joint (posterior facet syndrome), strengthen the lumbar spine, relieve pressure on a nerve, decompress a disc, or promote the influx of oxygen, blood flow, and

nutrients into the affected area. The secondary pending waveform is oscillation. This waveform is determined to affect the proprioceptor firing response. This may help prevent accommodation, guarding and muscle spasming, as well as enable a more effective treatment.

The bed is designed with comfort and safety in mind. The bed rotates into the vertical position to easily accommodate patients, even when incapacitated from pain.

This highly sophisticated device works with absolute precision to target specific segments of the spine for more effective treatment.

The patient is secured to the machine with both a stabilization chest and pelvic harness to ensure exact positioning and total comfort during treatment.

What Results Can I Expect?

1. Pain relief, even after just a few sessions
2. Shrinkage of disc herniation
3. Fewer incidents of back pain and debilitation
4. Return to active lifestyle
5. Increased mobilization
6. Quicker return to work
